

UGC Content Factory

Quick Start: Install + API Keys

Use this sheet to get the app running and connect OpenAI + Gemini/Veo 3.

1 Install the Program

Windows: Run the UGC Content Factory installer (.exe), then open the app from the Start Menu.
Mac: Open the DMG, drag the app into Applications, then launch it.
First launch: go to Settings and confirm your storage folder, FFmpeg status, and default render provider.
Local rendering: if using ComfyUI/Wan, start ComfyUI first and confirm it opens at <http://127.0.0.1:8188>.

2 Create Your OpenAI API Key

1. Go to platform.openai.com/api-keys and sign in.
2. Select your project, then choose Create new secret key.
3. Copy the key immediately. You usually cannot view the full secret again later.
4. In UGC Content Factory, paste it in Settings > API Keys > OpenAI API Key.

3 Create Your Gemini API Key for Veo 3

1. Go to aistudio.google.com/app/apikey and sign in with your Google account.
2. Click Create API key or choose an existing Google Cloud project.
3. Copy the key and save it safely.
4. In UGC Content Factory, paste it in Settings > API Keys > Gemini API Key.
5. Use this when choosing Veo 3 / Gemini Video as your render provider.

4 Add Keys Inside the App

Open the app and go to: Settings > API Keys
Paste:
- OPENAI_API_KEY for scripts, prompts, captions, and voice tools.
- GEMINI_API_KEY for Gemini/Veo 3 video generation.
Click Save, then use Test OpenAI and Test Gemini/Veo before generating your first project.

Important: Protect Your API Keys

Never share keys, post them online, commit them to GitHub, or send screenshots showing them. Use separate keys for each app/project when possible. Set usage limits or budgets in OpenAI/Google dashboards before heavy testing. If a key is exposed, delete it and create a new one immediately.

First Test Run

1. Open UGC Content Factory -> Settings -> API Keys -> Test both keys.
2. Create a small test project: 10-15 second UGC video or one AI Photo.
3. Choose render provider: Veo 3 for cloud quality, or Local ComfyUI/Wan for no-token local rendering.
4. Generate -> preview -> download/export your result.
